

FEATURES

Fully specified rail to rail at $V_{CC} = 2.5\text{ V to }5.5\text{ V}$
Input common-mode voltage from $-0.2\text{ V to }V_{CC} + 0.2\text{ V}$
Low glitch CMOS-/TTL-compatible output stage
40 ns propagation delay
Low power: 1 mW at 2.5 V
Shutdown pin
Power supply rejection > 60 dB
 $-40^{\circ}\text{C to }+125^{\circ}\text{C}$ operation

APPLICATIONS

High speed instrumentation
Clock and data signal restoration
Logic level shifting or translation
High speed line receivers
Threshold detection
Peak and zero-crossing detectors
High speed trigger circuitry
Pulse-width modulators
Current-/voltage-controlled oscillators

GENERAL DESCRIPTION

The **ADCMP608** is a fast comparator fabricated on XFCB2, an Analog Devices, Inc. proprietary process. This comparator is exceptionally versatile and easy to use. Features include an input range from $V_{EE} - 0.2\text{ V to }V_{CC} + 0.2\text{ V}$, low noise, TTL-/CMOS-compatible output drivers, and shutdown inputs. The device offers 40 ns propagation delays driving a 15 pF load with 10 mV overdrive on 500 μA typical supply current.

A flexible power supply scheme allows the device to operate with a single +2.5 V positive supply and a $-0.2\text{ V to }+2.7\text{ V}$ input signal range up to a +5.5 V positive supply with a $-0.2\text{ V to }+5.7\text{ V}$ input signal range.

FUNCTIONAL BLOCK DIAGRAM

Figure 1.

06769-001

The TTL-/CMOS-compatible output stage is designed to drive up to 15 pF with full rated timing specifications and to degrade in a graceful and linear fashion as additional capacitance is added. The input stage of the comparator offers robust protection against large input overdrive, and the outputs do not phase reverse when the valid input signal range is exceeded.

The **ADCMP608** is available in a tiny 6-lead SC70 package with a single-ended output and a shutdown pin.

Stresses at or above those listed under Absolute Maximum Ratings may cause permanent damage to the product. This is a stress rating only; functional operation of the product at these or any other conditions above those indicated in the operational section of this specification is not implied. Operation beyond the maximum operating conditions for extended periods may affect product reliability.

THERMAL RESISTANCE

θ_{JA} is specified for the worst-case conditions, that is, a device soldered in a circuit board for surface-mount packages.

ESD CAUTION

ESD (electrostatic discharge) sensitive device.

Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

PIN CONFIGURATION AND FUNCTION DESCRIPTIONS

Table 4. ADCMP608 Pin Function Descriptions

Pin No.	Mnemonic	Description
1	Q	Noninverting Output. Q is at logic high if the analog voltage at the noninverting input, V_P , is greater than the analog voltage at the inverting input, V_N .
2	V_{EE}	Negative Supply Voltage.
3	V_P	Noninverting Analog Input.
4	V_N	Inverting Analog Input.
5	S_{DN}	Shutdown. Drive this pin low to shut down the device.
6	V_{CC}	V_{CC} Supply.

CROSSOVER BIAS POINT

Rail-to-rail inputs of this type, in both op amps and comparators, have a dual front-end design. Certain devices are active near the V_{CC} rail and others are active near the V_{EE} rail. At some predetermined point in the common-mode range, a crossover occurs. At this point, normally $V_{CC}/2$, the direction of the bias current reverses and there are changes in measured offset voltages and currents.

The ADCMP608 slightly elaborates on this scheme. Crossover points can be found at approximately 0.8 V and 1.6 V.

MINIMUM INPUT SLEW RATE REQUIREMENT

With the rated load capacitance and normal good PC board design practice, as discussed in the Optimizing Performance section, these comparators should be stable at any input slew rate with no hysteresis. Broadband noise from the input stage is observed in place of the violent chattering seen with most other high speed comparators. With additional capacitive loading or poor bypassing, oscillation may be encountered. These oscillations are due to the high gain bandwidth of the comparator in combination with feedback through parasitics in the package and PC board. In many applications, chattering is not harmful.
