

New 8FX 8-bit Microcontrollers

The MB95560H/570H/580H Series is a series of general-purpose, single-chip microcontrollers. In addition to a compact instruction set, the microcontrollers of this series contain a variety of peripheral resources.

Features

- F²MC-8FX CPU core
 - Instruction set optimized for controllers
 - Multiplication and division instructions
 - 16-bit arithmetic operations
 - Bit test branch instructions
 - Bit manipulation instructions, etc.
- Clock (The main oscillation clock and the suboscillation clock are only available on MB95F562H/F562K/F563H/F563K/F564H/F564K/F582H/F582K/F583H/F583K/F584H/F584K.)
 - Selectable main clock source
 - Main oscillation clock (up to 16.25 MHz, maximum machine clock frequency: 8.125 MHz)
 - External clock (up to 32.5 MHz, maximum machine clock frequency: 16.25 MHz)
 - Main CR clock (4 MHz ± 2%)
 - The main CR clock frequency becomes 8 MHz when the PLL multiplication rate is 2.
 - The main CR clock frequency becomes 10 MHz when the PLL multiplication rate is 2.5.
 - The main CR clock frequency becomes 12 MHz when the PLL multiplication rate is 3.
 - The main CR clock frequency becomes 16 MHz when the PLL multiplication rate is 4.
 - Selectable subclock source
 - Suboscillation clock (32.768 kHz)
 - External clock (32.768 kHz)
 - Sub-CR clock (Typ: 100 kHz, Min: 50 kHz, Max: 150 kHz)
- Timer
 - 8/16-bit composite timer × 2 channels (only one channel on MB95F572H/F572K/F573H/F573K/F574H/F574K/F582H/F582K/F583H/F583K/F584H/F584K)
 - Time-base timer × 1 channel
 - Watch prescaler × 1 channel
- LIN-UART (only available on MB95F562H/F562K/F563H/F563K/F564H/F564K/F582H/F582K/F583H/F583K/F584H/F584K)
 - Full duplex double buffer
 - Capable of clock synchronous serial data transfer and clock asynchronous serial data transfer
- External interrupt
 - Interrupt by edge detection (rising edge, falling edge, and both edges can be selected)
 - Can be used to wake up the device from different low power consumption (standby) modes
- 8/10-bit A/D converter
 - 8-bit or 10-bit resolution can be selected.
- Low power consumption (standby) modes
 - There are four standby modes as follows:
 - Stop mode
 - Sleep mode
 - Watch mode
 - Time-base timer mode
 - In standby mode, the device can be made to enter either normal standby mode or deep standby mode.
- I/O port
 - MB95F562H/F563H/F564H (maximum no. of I/O ports: 16)
 - General-purpose I/O ports (CMOS I/O): 15
 - General-purpose I/O ports (N-ch open drain): 1
 - MB95F562K/F563K/F564K (maximum no. of I/O ports: 17)
 - General-purpose I/O ports (CMOS I/O): 15
 - General-purpose I/O ports (N-ch open drain): 2
 - MB95F572H/F573H/F574H (maximum no. of I/O ports: 4)
 - General-purpose I/O ports (CMOS I/O): 3
 - General-purpose I/O ports (N-ch open drain): 1
 - MB95F572K/F573K/F574K (maximum no. of I/O ports: 5)
 - General-purpose I/O ports (CMOS I/O): 3
 - General-purpose I/O ports (N-ch open drain): 2
 - MB95F582H/F583H/F584H (maximum no. of I/O ports: 12)
 - General-purpose I/O ports (CMOS I/O): 11
 - General-purpose I/O ports (N-ch open drain): 1
 - MB95F582K/F583K/F584K (maximum no. of I/O ports: 13)
 - General-purpose I/O ports (CMOS I/O): 11
 - General-purpose I/O ports (N-ch open drain): 2
- On-chip debug
 - 1-wire serial control
 - Serial writing supported (asynchronous mode)
- Hardware/software watchdog timer
 - Built-in hardware watchdog timer
 - Built-in software watchdog timer
- Power-on reset
 - A power-on reset is generated when the power is switched on.
- Low-voltage detection reset circuit (only available on MB95F562K/F563K/F564K/F572K/F573K/F574K/F582K/F583K/F584K)
 - Built-in low-voltage detector
- Clock supervisor counter
 - Built-in clock supervisor counter function
- Dual operation Flash memory
 - The program/erase operation and the read operation can be executed in different banks (upper bank/lower bank) simultaneously.
- Flash memory security function
 - Protects the content of the Flash memory.

1. Product Line-up

- MB95560H Series

Part number	MB95F562H	MB95F563H	MB95F564H	MB95F562K	MB95F563K	MB95F564K
Parameter						
Type	Flash memory product					
Clock supervisor counter	It supervises the main clock oscillation.					
Flash memory capacity	8 Kbyte	12 Kbyte	20 Kbyte	8 Kbyte	12 Kbyte	20 Kbyte
RAM capacity	240 bytes	496 bytes	496 bytes	240 bytes	496 bytes	496 bytes
Power-on reset	Yes					
Low-voltage detection reset	No			Yes		
Reset input	Dedicated			Selected through software		
CPU functions	<ul style="list-style-type: none"> • Number of basic instructions : 136 • Instruction bit length : 8 bits • Instruction length : 1 to 3 bytes • Data bit length : 1, 8 and 16 bits • Minimum instruction execution time : 61.5 ns (machine clock frequency = 16.25 MHz) • Interrupt processing time : 0.6 μs (machine clock frequency = 16.25 MHz) 					
General-purpose I/O	<ul style="list-style-type: none"> • I/O ports (Max) : 16 • CMOS I/O : 15 • N-ch open drain: 1 			<ul style="list-style-type: none"> • I/O ports (Max) : 17 • CMOS I/O : 15 • N-ch open drain: 2 		
Time-base timer	Interval time: 0.256 ms to 8.3 s (external clock frequency = 4 MHz)					
Hardware/software watchdog timer	<ul style="list-style-type: none"> • Reset generation cycle Main oscillation clock at 10 MHz: 105 ms (Min) • The sub-CR clock can be used as the source clock of the hardware watchdog timer. 					
Wild register	It can be used to replace 3 bytes of data.					
LIN-UART	<ul style="list-style-type: none"> • A wide range of communication speed can be selected by a dedicated reload timer. • It has a full duplex double buffer. • Both clock synchronous serial data transfer and clock asynchronous serial data transfer are enabled. • The LIN function can be used as a LIN master or a LIN slave. 					
8/10-bit A/D converter	6 channels 8-bit or 10-bit resolution can be selected.					
8/16-bit composite timer	2 channels <ul style="list-style-type: none"> • The timer can be configured as an "8-bit timer × 2 channels" or a "16-bit timer × 1 channel". • It has the following functions: interval timer function, PWC function, PWM function and input capture function. • Count clock: it can be selected from internal clocks (7 types) and external clocks. • It can output square wave. 					
External interrupt	6 channels <ul style="list-style-type: none"> • Interrupt by edge detection (The rising edge, falling edge, or both edges can be selected.) • It can be used to wake up the device from the standby mode. 					
On-chip debug	<ul style="list-style-type: none"> • 1-wire serial control • It supports serial writing (asynchronous mode). 					

Part number	MB95F562H	MB95F563H	MB95F564H	MB95F562K	MB95F563K	MB95F564K
Parameter						
Watch prescaler	Eight different time intervals can be selected.					
Flash memory	<ul style="list-style-type: none"> It supports automatic programming (Embedded Algorithm), and program/erase/erase-suspend/erase-resume commands. It has a flag indicating the completion of the operation of Embedded Algorithm. Flash security feature for protecting the content of the Flash memory 					
	Number of program/erase cycles		1000	10000	100000	
	Data retention time		20 years	10 years	5 years	
Standby mode	Sleep mode, stop mode, watch mode, time-base timer mode					
Package	LCC-32P-M19 FPT-20P-M09 FPT-20P-M10

3. Differences Among Products And Notes On Product Selection

- **Current consumption**
When using the on-chip debug function, take account of the current consumption of Flash memory program/erase. For details of current consumption, see “Electrical Characteristics”.
- **Package**
For details of information on each package, see “Packages And Corresponding Products” and “Package Dimension”.
- **Operating voltage**
The operating voltage varies, depending on whether the on-chip debug function is used or not. For details of the operating voltage, see “Electrical Characteristics”.
- **On-chip debug function**
The on-chip debug function requires that V_{CC} , V_{SS} and one serial wire be connected to an evaluation tool. For details of the connection method, refer to “CHAPTER 21 EXAMPLE OF SERIAL PROGRAMMING CONNECTION” in “New 8FX MB95560H/570H/580H Series Hardware Manual”.

11. Handling Precautions

Any semiconductor devices have inherently a certain rate of failure. The possibility of failure is greatly affected by the conditions in which they are used (circuit conditions, environmental conditions, etc.). This page describes precautions that must be observed to minimize the chance of failure and to obtain higher reliability from your Cypress semiconductor devices.

11.1 Precautions for Product Design

This section describes precautions when designing electronic equipment using semiconductor devices.

• Absolute Maximum Ratings

Semiconductor devices can be permanently damaged by application of stress (voltage, current, temperature, etc.) in excess of certain established limits, called absolute maximum ratings. Do not exceed these ratings.

• Recommended Operating Conditions

Recommended operating conditions are normal operating ranges for the semiconductor device. All the device's electrical characteristics are warranted when operated within these ranges.

Always use semiconductor devices within the recommended operating conditions. Operation outside these ranges may adversely affect reliability and could result in device failure.

No warranty is made with respect to uses, operating conditions, or combinations not represented on the data sheet. Users considering application outside the listed conditions are advised to contact their sales representative beforehand.

- **Processing and Protection of Pins**

These precautions must be followed when handling the pins which connect semiconductor devices to power supply and input/output functions.

- (1) Preventing Over-Voltage and Over-Current Conditions

Exposure to voltage or current levels in excess of maximum ratings at any pin is likely to cause deterioration within the device, and in extreme cases leads to permanent damage of the device. Try to prevent such overvoltage or over-current conditions at the design stage.

- (2) Protection of Output Pins

Shorting of output pins to supply pins or other output pins, or connection to large capacitance can cause large current flows. Such conditions if present for extended periods of time can damage the device.

Therefore, avoid this type of connection.

- (3) Handling of Unused Input Pins

Unconnected input pins with very high impedance levels can adversely affect stability of operation. Such pins should be connected through an appropriate resistance to a power supply pin or ground pin.

- **Latch-up**

Semiconductor devices are constructed by the formation of P-type and N-type areas on a substrate. When subjected to abnormally high voltages, internal parasitic PNPN junctions (called thyristor structures) may be formed, causing large current levels in excess of several hundred mA to flow continuously at the power supply pin. This condition is called latch-up.

CAUTION: The occurrence of latch-up not only causes loss of reliability in the semiconductor device, but can cause injury or damage from high heat, smoke or flame. To prevent this from happening, do the following:

- (1) Be sure that voltages applied to pins do not exceed the absolute maximum ratings. This should include attention to abnormal noise, surge levels, etc.

- (2) Be sure that abnormal current flows do not occur during the power-on sequence.

- **Observance of Safety Regulations and Standards**

Most countries in the world have established standards and regulations regarding safety, protection from electromagnetic interference, etc. Customers are requested to observe applicable regulations and standards in the design of products.

- **Fail-Safe Design**

Any semiconductor devices have inherently a certain rate of failure. You must protect against injury, damage or loss from such failures by incorporating safety design measures into your facility and equipment such as redundancy, fire protection, and prevention of over-current levels and other abnormal operating conditions.

- **Precautions Related to Usage of Devices**

Cypress semiconductor devices are intended for use in standard applications (computers, office automation and other office equipment, industrial, communications, and measurement equipment, personal or household devices, etc.).

CAUTION: Customers considering the use of our products in special applications where failure or abnormal operation may directly affect human lives or cause physical injury or property damage, or where extremely high levels of reliability are demanded (such as aerospace systems, atomic energy controls, sea floor repeaters, vehicle operating controls, medical devices for life support, etc.) are requested to consult with sales representatives before such use. The company will not be responsible for damages arising from such use without prior approval.

11.2 Precautions for Package Mounting

Package mounting may be either lead insertion type or surface mount type. In either case, for heat resistance during soldering, you should only mount under Cypress's recommended conditions. For detailed information about mount conditions, contact your sales representative.

• Lead Insertion Type

Mounting of lead insertion type packages onto printed circuit boards may be done by two methods: direct soldering on the board, or mounting by using a socket.

Direct mounting onto boards normally involves processes for inserting leads into through-holes on the board and using the flow soldering (wave soldering) method of applying liquid solder. In this case, the soldering process usually causes leads to be subjected to thermal stress in excess of the absolute ratings for storage temperature. Mounting processes should conform to Cypress recommended mounting conditions.

If socket mounting is used, differences in surface treatment of the socket contacts and IC lead surfaces can lead to contact deterioration after long periods. For this reason it is recommended that the surface treatment of socket contacts and IC leads be verified before mounting.

• Surface Mount Type

Surface mount packaging has longer and thinner leads than lead-insertion packaging, and therefore leads are more easily deformed or bent. The use of packages with higher pin counts and narrower pin pitch results in increased susceptibility to open connections caused by deformed pins, or shorting due to solder bridges.

You must use appropriate mounting techniques. Cypress recommends the solder reflow method, and has established a ranking of mounting conditions for each product. Users are advised to mount packages in accordance with Cypress ranking of recommended conditions.

• Lead-Free Packaging

CAUTION: When ball grid array (BGA) packages with Sn-Ag-Cu balls are mounted using Sn-Pb eutectic soldering, junction strength may be reduced under some conditions of use.

• Storage of Semiconductor Devices

Because plastic chip packages are formed from plastic resins, exposure to natural environmental conditions will cause absorption of moisture. During mounting, the application of heat to a package that has absorbed moisture can cause surfaces to peel, reducing moisture resistance and causing packages to crack. To prevent, do the following:

- (1) Avoid exposure to rapid temperature changes, which cause moisture to condense inside the product. Store products in locations where temperature changes are slight.
- (2) Use dry boxes for product storage. Products should be stored below 70% relative humidity, and at temperatures between 5°C and 30°C.
When you open Dry Package that recommends humidity 40% to 70% relative humidity.
- (3) When necessary, Cypress packages semiconductor devices in highly moisture-resistant aluminum laminate bags, with a silica gel desiccant. Devices should be sealed in their aluminum laminate bags for storage.
- (4) Avoid storing packages where they are exposed to corrosive gases or high levels of dust.

• Baking

Packages that have absorbed moisture may be de-moisturized by baking (heat drying). Follow the Cypress recommended conditions for baking.

Condition: 125°C/24 h

• Static Electricity

Because semiconductor devices are particularly susceptible to damage by static electricity, you must take the following precautions:

- (1) Maintain relative humidity in the working environment between 40% and 70%.
Use of an apparatus for ion generation may be needed to remove electricity.
- (2) Electrically ground all conveyors, solder vessels, soldering irons and peripheral equipment.
- (3) Eliminate static body electricity by the use of rings or bracelets connected to ground through high resistance (on the level of 1 M Ω).
Wearing of conductive clothing and shoes, use of conductive floor mats and other measures to minimize shock loads is recommended.
- (4) Ground all fixtures and instruments, or protect with anti-static measures.
- (5) Avoid the use of styrofoam or other highly static-prone materials for storage of completed board assemblies.

11.3 Precautions for Use Environment

Reliability of semiconductor devices depends on ambient temperature and other conditions as described above.

For reliable performance, do the following:

(1) Humidity

Prolonged use in high humidity can lead to leakage in devices as well as printed circuit boards. If high humidity levels are anticipated, consider anti-humidity processing.

(2) Discharge of Static Electricity

When high-voltage charges exist close to semiconductor devices, discharges can cause abnormal operation. In such cases, use anti-static measures or processing to prevent discharges.

(3) Corrosive Gases, Dust, or Oil

Exposure to corrosive gases or contact with dust or oil may lead to chemical reactions that will adversely affect the device. If you use devices in such conditions, consider ways to prevent such exposure or to protect the devices.

(4) Radiation, Including Cosmic Radiation

Most devices are not designed for environments involving exposure to radiation or cosmic radiation. Users should provide shielding as appropriate.

(5) Smoke, Flame

CAUTION: Plastic molded devices are flammable, and therefore should not be used near combustible substances. If devices begin to smoke or burn, there is danger of the release of toxic gases.

Customers considering the use of Cypress products in other special environmental conditions should consult with sales representatives.

12. Notes On Device Handling

- Preventing latch-ups

When using the device, ensure that the voltage applied does not exceed the maximum voltage rating.

In a CMOS IC, if a voltage higher than V_{CC} or a voltage lower than V_{SS} is applied to an input/output pin that is neither a medium-withstand voltage pin nor a high-withstand voltage pin, or if a voltage out of the rating range of power supply voltage mentioned in "24.1 Absolute Maximum Ratings" of "Electrical Characteristics" is applied to the V_{CC} pin or the V_{SS} pin, a latch-up may occur.

When a latch-up occurs, power supply current increases significantly, which may cause a component to be thermally destroyed.

- Stabilizing supply voltage

Supply voltage must be stabilized.

A malfunction may occur when power supply voltage fluctuates rapidly even though the fluctuation is within the guaranteed operating range of the V_{CC} power supply voltage.

As a rule of voltage stabilization, suppress voltage fluctuation so that the fluctuation in V_{CC} ripple (p-p value) at the commercial frequency (50 Hz/60 Hz) does not exceed 10% of the standard V_{CC} value, and the transient fluctuation rate does not exceed 0.1 V/ms at a momentary fluctuation such as switching the power supply.

- Notes on using the external clock
When an external clock is used, oscillation stabilization wait time is required for power-on reset, wake-up from subclock mode or stop mode.

13. Pin Connection

- Treatment of unused pins
If an unused input pin is left unconnected, a component may be permanently damaged due to malfunctions or latch-ups. Always pull up or pull down an unused input pin through a resistor of at least 2 k Ω . Set an unused input/output pin to the output state and leave it unconnected, or set it to the input state and treat it the same as an unused input pin. If there is an unused output pin, leave it unconnected.
- Power supply pins
To reduce unnecessary electro-magnetic emission, prevent malfunctions of strobe signals due to an increase in the ground level, and conform to the total output current standard, always connect the V_{CC} pin and the V_{SS} pin to the power supply and ground outside the device. In addition, connect the current supply source to the V_{CC} pin and the V_{SS} pin with low impedance.
It is also advisable to connect a ceramic capacitor of approximately 0.1 μ F as a decoupling capacitor between the V_{CC} pin and the V_{SS} pin at a location close to this device.
- DBG pin
Connect the DBG pin to an external pull-up resistor of 2 k Ω or above.
After power-on, ensure that the DBG pin does not stay at "L" level until the reset output is released.
The DBG pin becomes a communication pin in debug mode. Since the actual pull-up resistance depends on the tool used and the interconnection length, refer to the tool document when selecting a pull-up resistor.
- \overline{RST} pin
Connect the \overline{RST} pin to an external pull-up resistor of 2 k Ω or above.
To prevent the device from unintentionally entering the reset mode due to noise, minimize the interconnection length between a pull-up resistor and the \overline{RST} pin and that between a pull-up resistor and the V_{CC} pin when designing the layout of the printed circuit board.
The PF2/ \overline{RST} pin functions as the reset input/output pin after power-on. In addition, the reset output of the PF2/ \overline{RST} pin can be enabled by the RSTOE bit in the SYSC register, and the reset input function and the general purpose I/O function can be selected by the RSTEN bit in the SYSC register.
- C pin
Use a ceramic capacitor or a capacitor with equivalent frequency characteristics. The decoupling capacitor for the V_{CC} pin must have a capacitance equal to or larger than the capacitance of C_s . For the connection to a decoupling capacitor C_s , see the diagram below. To prevent the device from unintentionally entering a mode to which the device is not set to transit due to noise, minimize the distance between the C pin and C_s and the distance between C_s and the V_{SS} pin when designing the layout of a printed circuit board.

24. Electrical Characteristics

24.1 Absolute Maximum Ratings

Parameter	Symbol	Rating		Unit	Remarks
		Min	Max		
Power supply voltage*1	V_{CC}	$V_{SS} - 0.3$	$V_{SS} + 6$	V	
Input voltage*1	V_I	$V_{SS} - 0.3$	$V_{SS} + 6$	V	*2
Output voltage*1	V_O	$V_{SS} - 0.3$	$V_{SS} + 6$	V	*2
Maximum clamp current	I_{CLAMP}	-2	+2	mA	Applicable to specific pins ^{*3}
Total maximum clamp current	$\sum I_{CLAMP} $	—	20	mA	Applicable to specific pins ^{*3}
“L” level maximum output current	I_{OL}	—	15	mA	
“L” level average current	I_{OLAV1}	—	4	mA	Other than P00 to P03, P05 to P07, P62 to P64 ^{*4} Average output current= operating current × operating ratio (1 pin)
	I_{OLAV2}		12		P00 to P03, P05 to P07, P62 to P64 ^{*4} Average output current= operating current × operating ratio (1 pin)
“L” level total maximum output current	$\sum I_{OL}$	—	100	mA	
“L” level total average output current	$\sum I_{OLAV}$	—	50	mA	Total average output current= operating current × operating ratio (Total number of pins)
“H” level maximum output current	I_{OH}	—	-15	mA	
“H” level average current	I_{OHAV1}	—	-4	mA	Other than P00 to P03, P05 to P07, P62 to P64 ^{*4} Average output current= operating current × operating ratio (1 pin)
	I_{OHAV2}		-8		P00 to P03, P05 to P07, P62 to P64 ^{*4} Average output current= operating current × operating ratio (1 pin)
“H” level total maximum output current	$\sum I_{OH}$	—	-100	mA	
“H” level total average output current	$\sum I_{OHAV}$	—	-50	mA	Total average output current= operating current × operating ratio (Total number of pins)
Power consumption	P_d	—	320	mW	
Operating temperature	T_A	-40	+85	°C	
Storage temperature	T_{stg}	-55	+150	°C	

*1: These parameters are based on the condition that V_{SS} is 0.0 V.

- *2: V_i and V_o must not exceed $V_{CC} + 0.3$ V. V_i must not exceed the rated voltage. However, if the maximum current to/from an input is limited by means of an external component, the I_{CLAMP} rating is used instead of the V_i rating.
- *3: Applicable to the following pins: P00 to P07, P62 to P64, PF0, PF1, PG1, PG2 (P00, and P62 to P64 are only available on MB95F562H/F562K/F563H/F563K/F564H/F564K. P01, P02, P03, P07, PF0, PF1, PG1, and PG2 are only available on MB95F562H/F562K/F563H/F563K/F564H/F564K/F582H/F582K/F583H/F583K/F584H/F584K.)
 - Use under recommended operating conditions.
 - Use with DC voltage (current).
 - The HV (High Voltage) signal is an input signal exceeding the V_{CC} voltage. Always connect a limiting resistor between the HV (High Voltage) signal and the microcontroller before applying the HV (High Voltage) signal.
 - The value of the limiting resistor should be set to a value at which the current to be input to the microcontroller pin when the HV (High Voltage) signal is input is below the standard value, irrespective of whether the current is transient current or stationary current.
 - When the microcontroller drive current is low, such as in low power consumption modes, the HV (High Voltage) input potential may pass through the protective diode to increase the potential of the V_{CC} pin, affecting other devices.
 - If the HV (High Voltage) signal is input when the microcontroller power supply is off (not fixed at 0 V), since power is supplied from the pins, incomplete operations may be executed.
 - If the HV (High Voltage) input is input after power-on, since power is supplied from the pins, the voltage of power supply may not be sufficient to enable a power-on reset.
 - Do not leave the HV (High Voltage) input pin unconnected.
 - Example of a recommended circuit:

- *4: P62 and P63 are only available on MB95F562H/F562K/F563H/F563K/F564H/F564K.

WARNING: Semiconductor devices may be permanently damaged by application of stress (including, without limitation, voltage, current or temperature) in excess of absolute maximum ratings. Do not exceed any of these ratings.

24.2 Recommended Operating Conditions

(V_{SS} = 0.0 V)

Parameter	Symbol	Value		Unit	Remarks	
		Min	Max			
Power supply voltage	V _{CC}	2.4*1, *2	5.5*1	V	In normal operation	Other than on-chip debug mode
		2.3	5.5		Hold condition in stop mode	
		2.9	5.5		In normal operation	On-chip debug mode
		2.3	5.5		Hold condition in stop mode	
Decoupling capacitor	C _s	0.022	1	μF	*3	
Operating temperature	T _A	-40	+85	°C	Other than on-chip debug mode	
		+5	+35		On-chip debug mode	

- *1: The value varies depending on the operating frequency, the machine clock and the analog guaranteed range.
- *2: The minimum power supply voltage becomes 2.88 V when a product with the low-voltage detection reset is used.
- *3: Use a ceramic capacitor or a capacitor with equivalent frequency characteristics. The decoupling capacitor for the V_{CC} pin must have a capacitance equal to or larger than the capacitance of C_s. For the connection to a decoupling capacitor C_s, see the diagram below. To prevent the device from unintentionally entering an unknown mode due to noise, minimize the distance between the C pin and C_s and the distance between C_s and the V_{SS} pin when designing the layout of a printed circuit board.

• **DBG / $\overline{\text{RST}}$ / C pins connection diagram**

*: Connect the DBG pin to an external pull-up resistor of 2 kΩ or above. After power-on, ensure that the DBG pin does not stay at “L” level until the reset output is released. The DBG pin becomes a communication pin in debug mode. Since the actual pull-up resistance depends on the tool used and the interconnection length, refer to the tool document when selecting a pull-up resistor.

WARNING: The recommended operating conditions are required in order to ensure the normal operation of the semiconductor device. All of the device's electrical characteristics are warranted when the device is operated under these conditions.

Any use of semiconductor devices will be under their recommended operating condition. Operation under any conditions other than these conditions may adversely affect reliability of device and could result in device failure.

No warranty is made with respect to any use, operating conditions or combinations not represented on this data sheet. If you are considering application under any conditions other than listed herein, please contact sales representatives beforehand.

24.3 DC Characteristics

($V_{CC} = 5.0\text{ V} \pm 10\%$, $V_{SS} = 0.0\text{ V}$, $T_A = -40\text{ }^\circ\text{C}$ to $+85\text{ }^\circ\text{C}$)

Parameter	Symbol	Pin name	Condition	Value			Unit	Remarks
				Min	Typ	Max

	I _{CCSCR}			Sub-CR clock mode (divided by 2) T _A = +25 °C	—	58	64	μA	
	I _{CCTS}		V _{CC} (External clock operation)	F _{CH} = 32 MHz Time-base timer mode T _A = +25 °C	—	290	340	μA	In deep standby mode
I _{CCCH}	Main stop mode (single external clock product)/ Substop mode (dual external clock product) T _A = +25 °C	—		4.1	6.5	μA	In deep standby mode		

($V_{CC} = 5.0\text{ V} \pm 10\%$, $V_{SS} = 0.0\text{ V}$, $T_A = -40\text{ }^\circ\text{C}$ to $+85\text{ }^\circ\text{C}$)

Parameter	Symbol	Pin name	Condition	Value			Unit	Remarks
				Min	Typ ^{*1}	Max ^{*2}		
Power supply current ^{*5}	I _{LVD}	V _{CC}	Current consumption for the low-voltage detection circuit	—	3.6	6.6	μA	
	I _{CRH}		Current consumption for the main CR oscillator	—	220	280	μA	
	I _{CRL}		Current consumption for the sub-CR oscillator oscillating at 100 kHz	—	5.1	9.3	μA	
	I _{INSTBY}		Current consumption difference between normal standby mode and deep standby mode T _A = +25 °C	—	20	30	μA	

*1: $V_{CC} = 5.0\text{ V}$, $T_A = +25\text{ }^\circ\text{C}$

*2: $V_{CC} = 5.5\text{ V}$, $T_A = +85\text{ }^\circ\text{C}$ (unless otherwise specified)

*3: P00, P62, P63 and P64 are only available on MB95F562H/F562K/F563H/F563K/F564H/F564K.

*4: P01, P02, P03, P07, PF0, PF1, PG1 and PG2 are only available on MB95F562H/F562K/F563H/F563K/F564H/F564K/F582H/F582K/F583H/F583K/F584H/F584K.

*5: • The power supply current is determined by the external clock. When the low-voltage detection option is selected, the power-supply current will be the sum of adding the current consumption of the low-voltage detection circuit (I_{LVD}) to one of the value from I_{CC} to I_{CH}. In addition, when both the low-voltage detection option and the CR oscillator are selected, the power supply current will be the sum of adding up the current consumption of the low-voltage detection circuit, the current consumption of the CR oscillators (I_{CRH}, I_{CRL}) and a specified value. In on-chip debug mode, the CR oscillator (I_{CRH}) and the low-voltage detection circuit are always enabled, and current consumption therefore increases accordingly.

- See “24.4 AC Characteristics: Clock Timing” for F_{CH} and F_{CL}.
- See “24.4 AC Characteristics: Source Clock / Machine Clock” for F_{MP} and F_{MPL}.

*6: In sub-CR clock mode, the power supply current value is the sum of adding I_{CRL} to I_{CCLS} or I_{CC}. In addition, when the sub-CR clock mode is selected with F_{MPL} being 50 kHz, the current consumption increases accordingly.

24.4 AC Characteristics

24.4.1 Clock Timing

*1: This is the clock before it is divided according to the division ratio set by the machine clock division ratio select bits (SYCC:DIV[1:0]). This source clock is divided to become a machine clock according to the division ratio set by the machine clock division ratio select bits (SYCC:DIV[1:0]). In addition, a source clock can be selected from the following.

- Main clock divided by 2
- Main CR clock
- PLL multiplication of main CR clock (Select a multiplication rate from 2, 2.5, 3 and 4.)
- Subclock divided by 2
- Sub-CR clock divided by 2

*2: This is the operating clock of the microcontroller. A machine clock can be selected from the following.

- Source clock (no division)
- Source clock divided by 4
- Source clock divided by 8
- Source clock divided by 16

• Schematic diagram of the clock generation block

24.4.7 Low-voltage Detection

($V_{SS} = 0.0\text{ V}$, $T_A = -40\text{ }^\circ\text{C}$ to $+85\text{ }^\circ\text{C}$)

Parameter	Symbol	Value			Unit	Remarks
		Min	Typ	Max		
Release voltage*	V_{DL+}	2.52	2.7	2.88	V	At power supply rise
		2.61	2.8	2.99		
		2.89	3.1	3.31		
		3.08	3.3	3.52		
Detection voltage*	V_{DL-}	2.43	2.6	2.77	V	At power supply fall
		2.52	2.7	2.88		
		2.80	3	3.20		
		2.99	3.2	3.41		
Hysteresis width	V_{HYS}	—	100	—	mV	
Power supply start voltage	V_{off}	—	—	2.3	V	
Power supply end voltage	V_{on}	4.9	—	—	V	
Power supply voltage change time (at power supply rise)	t_r	650	—	—	μs	Slope of power supply that the reset release signal generates within the rating (V_{DL+})
Power supply voltage change time (at power supply fall)	t_f	650	—	—	μs	Slope of power supply that the reset detection signal generates within the rating (V_{DL-})
Reset release delay time	t_{d1}	—	—	30	μs	
Reset detection delay time	t_{d2}	—	—	30	μs	
LVD threshold voltage transition stabilization time	t_{stb}	10	—	—	μs	

*: The release voltage and the detection voltage can be selected by using the LVD reset voltage selection ID register (LVDR) in the low-voltage detection reset circuit. For details of the LVDR register, refer to “CHAPTER 18 LOW-VOLTAGE DETECTION RESET CIRCUIT” in “New 8FX MB95560H/570H/580H Series Hardware Manual”.

24.5 A/D Converter

24.5.1 A/D Converter Electrical Characteristics

($V_{CC} = 2.7\text{ V to }5.5\text{ V}$, $V_{SS} = 0.0\text{ V}$, $T_A = -40\text{ }^\circ\text{C to }+85\text{ }^\circ\text{C}$)

Parameter	Symbol	Value			Unit	Remarks
		Min	Typ	Max		
Resolution		—	—	10	bit	
Total error		-3	—	+3	LSB	
Linearity error	—	-2.5	—	+2.5	LSB	
Differential linearity error		-1.9	—	+1.9	LSB	
Zero transition voltage	V_{0T}	$V_{SS} - 1.5\text{ LSB}$	$V_{SS} + 0.5\text{ LSB}$	$V_{SS} + 2.5\text{ LSB}$	V	
Full-scale transition voltage	V_{FST}	$V_{CC} - 4.5\text{ LSB}$	$V_{CC} - 2\text{ LSB}$	$V_{CC} + 0.5\text{ LSB}$	V	
Compare time	—	1	—	10	μs	$4.5\text{ V} \leq V_{CC} \leq 5.5\text{ V}$
		3	—	10	μs	$2.7\text{ V} \leq V_{CC} < 4.5\text{ V}$
Sampling time	—	0.6	—	∞	μs	$2.7\text{ V} \leq V_{CC} \leq 5.5\text{ V}$, with external impedance $< 3.3\text{ k}\Omega$
Analog input current	I_{AIN}	-0.3	—	+0.3	μA	
Analog input voltage	V_{AIN}	V_{SS}	—	V_{CC}	V	

24.5.2 Notes on Using A/D Converter

• External impedance of analog input and its sampling time

The A/D converter of the MB95560H/570H/580H Series has a sample and hold circuit. If the external impedance is too high to keep sufficient sampling time, the analog voltage charged to the capacitor of the internal sample and hold circuit is insufficient, adversely affecting A/D conversion precision. Therefore, to satisfy the A/D conversion precision standard, considering the relationship between the external impedance and minimum sampling time, either adjust the register value and operating frequency or decrease the external impedance so that the sampling time is longer than the minimum value. In addition, if sufficient sampling time cannot be secured, connect a capacitor of about 0.1 μF to the analog input pin.

• Analog input equivalent circuit

V _{CC}	R	C
4.5 V ≤ V _{CC} ≤ 5.5 V	1.45 kΩ (Max)	14.89 pF (Max)
2.7 V ≤ V _{CC} < 4.5 V	2.7 kΩ (Max)	14.89 pF (Max)

Note: The values are reference values.

• Relationship between external impedance and minimum sampling time

—— Minimum sampling time with V_{CC} > 2.7 V
 - - - - Minimum sampling time with V_{CC} > 2.4 V

• A/D conversion error

As $|V_{CC} - V_{SS}|$ decreases, the A/D conversion error increases proportionately.

24.5.3 Definitions of A/D Converter Terms

- Resolution
 It indicates the level of analog variation that can be distinguished by the A/D converter.
 When the number of bits is 10, analog voltage can be divided into $2^{10} = 1024$.
- Linearity error (unit: LSB)
 It indicates how much an actual conversion value deviates from the straight line connecting the zero transition point (“0000000000” ← → “0000000001”) of a device to the full-scale transition point (“1111111111” ← → “1111111110”) of the same device.
- Differential linear error (unit: LSB)
 It indicates how much the input voltage required to change the output code by 1 LSB deviates from an ideal value.
- Total error (unit: LSB)
 It indicates the difference between an actual value and a theoretical value. The error can be caused by a zero transition error, a full-scale transition errors, a linearity error, a quantum error, or noise.

24.6 Flash Memory Program/Erase Characteristics

Parameter	Value			Unit	Remarks
	Min	Typ	Max		
Sector erase time (2 Kbyte sector)	—	0.3* ¹	1.6* ²	s	The time of writing 00 _H prior to erasure is excluded.
Sector erase time (16 Kbyte sector)	—	0.6* ¹	3.1* ²	s	The time of writing 00 _H prior to erasure is excluded.
Byte writing time	—	17	272	μs	System-level overhead is excluded.
Program/erase cycle	100000	—	—	cycle	
Power supply voltage at program/erase	2.4	—	5.5	V	
Flash memory data retention time	5* ³	—	—	year	Average T _A = +85 °C

*1: V_{CC} = 5.5 V, T_A = +25 °C, 0 cycle

*2: V_{CC} = 2.4 V, T_A = +85 °C, 100000 cycles

*3: This value was converted from the result of a technology reliability assessment. (The value was converted from the result of a high temperature accelerated test using the Arrhenius equation with an average temperature of +85 °C).

25. Sample Characteristics

- Power supply current temperature characteristics

$I_{CCLS} - V_{CC}$

$T_A = +25\text{ }^\circ\text{C}$, $F_{MPL} = 16\text{ kHz}$ (divided by 2)
 Subsleep mode with the external clock operating

$I_{CCLS} - T_A$

$V_{CC} = 5.5\text{ V}$, $F_{MPL} = 16\text{ kHz}$ (divided by 2)
 Subsleep mode with the external clock operating

MB95F572HPH-G-SNE2 MB95F572KPH-G-SNE2 MB95F573HPH-G-SNE2 MB95F573KPH-G-SNE2 MB95F574HPH-G-SNE2 MB95F574KPH-G-SNE2	8-pin plastic DIP (DIP-8P-M03)
MB95F572HPF-G-SNE2 MB95F572KPF-G-SNE2 MB95F573HPF-G-SNE2 MB95F573KPF-G-SNE2 MB95F574HPF-G-SNE2 MB95F574KPF-G-SNE2	8-pin plastic SOP (FPT-8P-M08)

28. Package Dimension

<p>32-pin plastic QFN</p>  <p>(LCC-32P-M19)</p>	Lead pitch	0.50 mm	
	Package width × package length	5.00 mm × 5.00 mm	
	Sealing method	Plastic mold	
	Mounting height	0.80 mm MAX	
	Weight	0.06 g	

<p>20-pin plastic SOP</p>  <p>(FPT-20P-M09)</p>	Lead pitch	1.27 mm
	Package width × package length	7.50 mm × 12.70 mm
	Lead shape	Gullwing
	Lead bend direction	Normal bend
	Sealing method	Plastic mold
	Mounting height	2.65 mm Max

<p style="text-align: center;">20-pin plastic TSSOP</p>  <p style="text-align: center;">(FPT-20P-M10)</p>	Lead pitch	0.65 mm
	Package width × package length	4.40 mm × 6.50 mm
	Lead shape	Gullwing
	Sealing method	Plastic mold
	Mounting height	1.20 mm MAX
	Weight	0.08 g

<p>16-pin plastic TSSOP</p>  <p>(FPT-16P-M08)</p>	Lead pitch	0.65 mm
	Package width × package length	4.40 mm × 4.96 mm
	Lead shape	Gullwing
	Sealing method	Plastic mold
	Mounting height	1.20 mm Max
	Weight	0.06 g

16-pin plastic TSSOP
(FPT-16P-M08)

Note 1) Pins width and pins thickness include plating thickness.
 Note 2) Pins width do not include tie bar cutting remainder.
 Note 3) * : These dimensions do not include resin protrusion.

Top view dimensions:
 *4.96±0.10(.195±.004)
 *4.40±0.10(.173±.004)
 6.40±0.20(.252±.008)
 INDEX

Lead dimensions:
 LEAD No. 1
 0.65(.026)
 0.24±0.08(.009±.003)
 0.13(.005) M
 0.10(.004)

Lead detail "A" dimensions:
 0.145±0.045(.0057±.0018)
 1.10^{+0.10}/_{-0.15} (.043^{+0.04}/_{-0.06}) (Mounting height)
 0-8°
 0.60±0.15(.024±.006)
 0.10±0.05(.004±.002) (Stand off)

Dimensions in mm (inches).
 Note: The values in parentheses are reference values.

<p>16-pin plastic SOP</p>  <p>(FPT-16P-M23)</p>	Lead pitch	1.27 mm
	Package width × package length	3.90 mm × 9.96 mm
	Lead shape	Gullwing
	Sealing method	Plastic mold
	Mounting height	1.75 mm MAX
	Weight	0.12 g

<p>8-pin plastic DIP</p>  <p>(DIP-8P-M03)</p>	Lead pitch	2.54 mm
	Sealing method	Plastic mold

<p style="text-align: center;">8-pin plastic SOP</p>  <p style="text-align: center;">(FPT-8P-M08)</p>	Lead pitch	1.27 mm
	Package width × package length	5.30 mm × 5.24 mm
	Lead shape	Gullwing
	Lead bend direction	Normal bend
	Sealing method	Plastic mold
	Mounting height	2.10 mm Max

8-pin plastic SOP
(FPT-8P-M08)

Note 1) Pins width and pins thickness include plating thickness.
 Note 2) Pins width do not include tie bar cutting remainder.
 Note 3) # : These dimensions do not include resin protrusion.

29. Major Changes In This Edition

Spanson Publication Number: DS702-00010-5v0-E

Page	Section	Details
—	—	<p>Changed the series name. MB95560H Series → MB95560H/570H/580H Series</p> <p>Added information on the MB95570H Series.</p> <p>Added information on the MB95580H Series.</p>
27	<ul style="list-style-type: none"> ■ PIN CONNECTION • DBG pin 	Revised details of “• DBG pin”.
	<ul style="list-style-type: none"> • $\overline{\text{RST}}$ pin 	Revised details of “• $\overline{\text{RST}}$ pin”.
28	<ul style="list-style-type: none"> • C pin 	<p>Corrected the following statement. The decoupling capacitor for the V_{CC} pin must have a capacitance larger than C_s. → The decoupling capacitor for the V_{CC} pin must have a capacitance equal to or larger than the capacitance of C_s.</p>
39	<ul style="list-style-type: none"> ■ I/O MAP (MB95570H Series) 	<p>Corrected the R/W attribute of the CMDR register. R/W → R</p> <p>Corrected the R/W attribute of the WDTL register. R/W → R</p> <p>Corrected the R/W attribute of the WDTL register. R/W → R</p>
42	<ul style="list-style-type: none"> ■ I/O MAP (MB95580H Series) 	<p>Corrected the R/W attribute of the CMDR register. R/W → R</p> <p>Corrected the R/W attribute of the WDTL register. R/W → R</p> <p>Corrected the R/W attribute of the WDTL register. R/W → R</p>
46	<ul style="list-style-type: none"> ■ ELECTRICAL CHARACTERISTICS 1. Absolute Maximum Ratings 	<p>Corrected the rating of the parameter ““L” level total maximum output current”. 48 → 100</p> <p>Corrected the rating of the parameter ““H” level total maximum output current”. 48 → -100</p>

Page	Section	Details
48	2. Recommended Operating Conditions	Revised note *2. The value is 2.88 V when the low-voltage detection reset is used. → The minimum power supply voltage becomes 2.18 V when a product with the low-voltage detection reset is used.
		Corrected the following statement in note *3. The decoupling capacitor for the V _{cc} pin must have a capacitance larger than C _s . → The decoupling capacitor for the V _{cc} pin must have a capacitance equal to or larger than the capacitance of C _s .
		Revised the remark in “• DBG/RST/C pins connection diagram”.
49	3. DC Characteristics	Revised the remark of the parameter “Input leak current (Hi-Z output leak current)”. When pull-up resistance is disabled → When the internal pull-up resistor is disabled
		Renamed the parameter “Pull-up resistance” to “Internal pull-up resistor”.
		Revised the remark of the parameter “Internal pull-up resistor”. When pull-up resistance is enabled → When the internal pull-up resistor is enabled
53	4. AC Characteristics (1) Clock Timing	Corrected the pin names of the parameter “Input clock rising time and falling time”. X0 → X0, X0A X0, X1 → X0, X1, X0A, X1A

- Major changes from third edition to fourth edition

Page	Section	Details
23 to 26	■ HANDLING PRECAUTIONS	New section
35	■ I/O MAP (MB95560H Series)	Corrected the R/W attribute of the CMDR register. R/W → R
52	■ ELECTRICAL CHARACTERISTICS 4. AC Characteristics (1) Clock Timing	Corrected the operating conditions of F_{CRH} of the parameter "Clock frequency". $0\text{ }^{\circ}\text{C} \leq T_A < +70\text{ }^{\circ}\text{C}$ → $0\text{ }^{\circ}\text{C} \leq T_A \leq +70\text{ }^{\circ}\text{C}$ $+70\text{ }^{\circ}\text{C} \leq T_A < +85\text{ }^{\circ}\text{C}$ → $+70\text{ }^{\circ}\text{C} \leq T_A \leq +85\text{ }^{\circ}\text{C}$
		Corrected the operating conditions of F_{MCRPLL} of the parameter "Clock frequency". $0\text{ }^{\circ}\text{C} \leq T_A < +70\text{ }^{\circ}\text{C}$ → $0\text{ }^{\circ}\text{C} \leq T_A \leq +70\text{ }^{\circ}\text{C}$ $+70\text{ }^{\circ}\text{C} \leq T_A < +85\text{ }^{\circ}\text{C}$ → $+70\text{ }^{\circ}\text{C} < T_A \leq +85\text{ }^{\circ}\text{C}$
68	5. A/D Converter (1) A/D Converter Electrical Characteristics	Corrected the symbol of the parameter "Zero transition voltage". $V_{OT} \rightarrow V_{0T}$
69	5. A/D Converter (2) Notes on Using A/D Converter • Analog input equivalent circuit	Corrected the range of V_{CC} . $2.7\text{ V} \leq V_{CC} < 5.5\text{ V}$ → $2.7\text{ V} \leq V_{CC} < 4.5\text{ V}$
		Corrected the values of R. $3.3\text{ k}\Omega \rightarrow 1.45\text{ k}\Omega$ $5.7\text{ k}\Omega \rightarrow 2.7\text{ k}\Omega$
70, 71	5. A/D Converter (3) Definitions of A/D Converter Terms	Corrected the symbol of the zero transition voltage. $V_{OT} \rightarrow V_{0T}$

NOTE: Please see "Document History" about later revised information.

Document History Page

Document Title: MB95560H Series, MB95570H Series, MB95580H Series, New 8FX 8-bit Microcontrollers				
Document Number: 002-04629				
Revision	ECN	Orig. of Change	Submission Date	Description of Change
**	-	AKIH	05/27/2013	Migrated to Cypress and assigned document number 002-04629. No change to document contents or format.
*A	5193921	AKIH	03/29/2016	Updated to Cypress template Updated 24.4.3 External Reset Added MB95F564KPF-G-UNE2, MB95F564KPFT-G-UNE2 in "Ordering Information".
